Kevin -

There is a system in north Rialto that has been constructed and is in startup testing, and a second system planned for the leading edge of the perchlorate plume.

There are annual sampling reports for each project. The most recent reports are from October/November 2016 and are on the EPA webpage. The 2017 sampling reports will be available later this year. There are also two new well clusters in construction or planned for the leading edge of the plume. Data from the first of those two well clusters should also be available later this year.

Subject: Rialto Perchlorate

Hello Wayne,
Has EPA released the report on construction and operation of the perchlorate treatment system in Rialto (well construction and sampling reports)?

Best,
Kevin
